

## Properties

- Robust Construction
- Stainless Steel Housing
- Relativ- and Absolut Pressure- Versions
- Measuring range from -1 up to 600 bar
- Several Output Signals
- Voltage supply 18...30 VDC
- Built-in amplifier
- Temperature Compensation

## Applications

- Hydraulics/ Pneumatics
- Conveying Machinery
- Mechanical Engineering
- Testbench
- Mobil Hydraulics, Vehicles, Farm machines
- Development and Laboratory
- Manufacturing Technology
- Ship Building Industry
- Aerospace
- Offshore

The SensoControl-program offers a wide range of pressure sensors for several applications and measuring ranges.

These sensors have been designed for the requirements of industrial instrumentation systems.

Accordingly, the housings and all components in contact with the medium are made of stainless steel. Thus giving compatibility with a wide range of media. There is a choice of several plug connectors of either DIN or waterproof types.

For the input, three relative and nine absolute pressure-measuring ranges are available.

There is a choice of output signals in the form of either voltage or current signals.

Sensors with output signals from 4...20 mA are available in two or three wire technology .

The built-in voltage regulator allows the sensors to be

operated with a supply voltage of 18...30 VDC. The sensors are manufactured in own production facility, typical by Parker Hannifin's commitment to flexibility and quality.

## Functional Descriptions

The pressure of the measuring fluid is exerted on the separating membrane of the piezoresistive pressure element. The separating membrane transmits the applied pressure via the separating liquid to the sensor silicon chip ①.

The piezoresistive, temperature compensated Wheatstone measuring bridge is fed by a constant-voltage source ②. The output signal of the measuring bridge is amplified in a difference amplifier having high input resistance ③ and good common-mode rejection. The signal is preprocessed in the subsequent amplifier and is then available as 0(4)...20 mA output signal at the U/I converter ④. The SCPT sensors also have a temperature output ⑤.

All **SensoControl**-sensors for diagnostic purposes are equipped with sensor recognition ⑥ thus ensuring automatic scaling on connection with the **SensoControl**-measuring devices (plug & play).

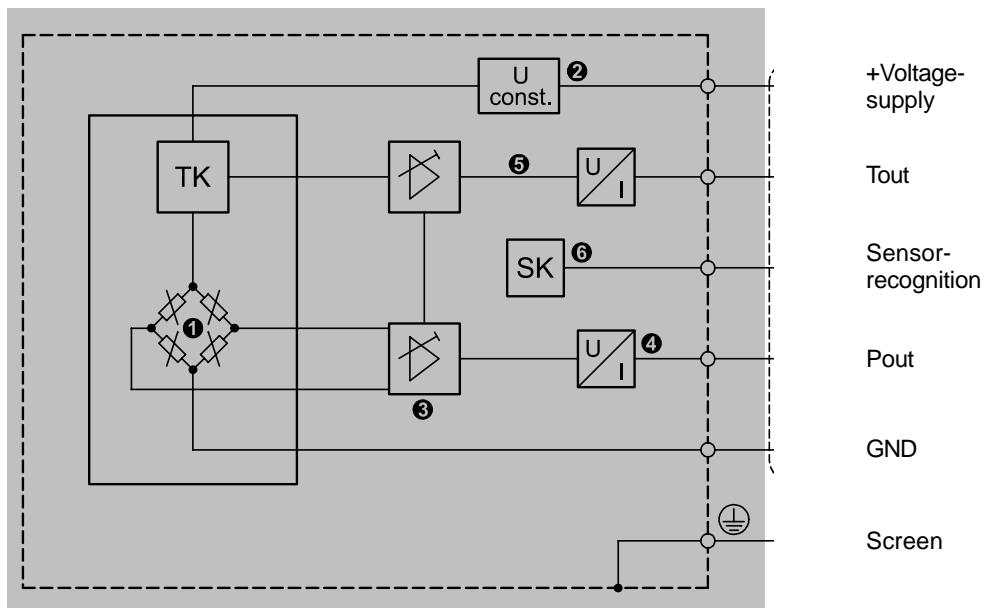

Fig. 1: Block-diagram (for example SCPT-XXX-0-02)

### Non-Conformity with Tolerance Band Setting

When the characteristic is known, the sensor is set so that the non-conformity of the actual characteristic with the ideal characteristic is minimal. The greatest difference is indicated as  $\pm$  non-conformity. The greatest errors occur at the beginning, the end and in the middle of the measuring range.

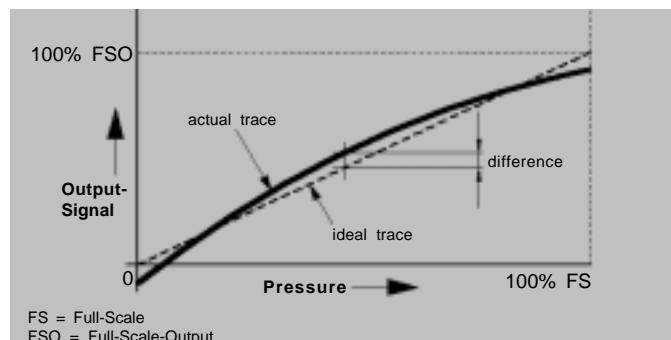

Fig. 2: Typical non linear trace

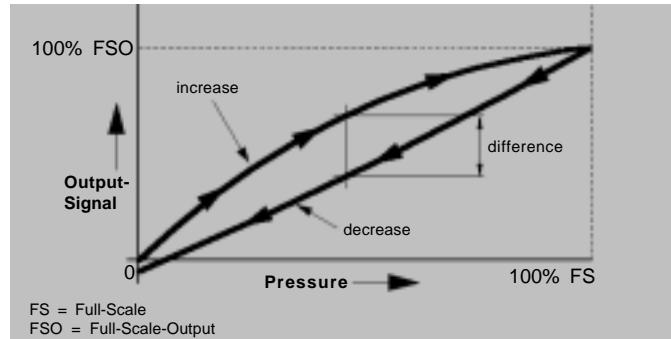

Fig. 3: Typical Hysteresis

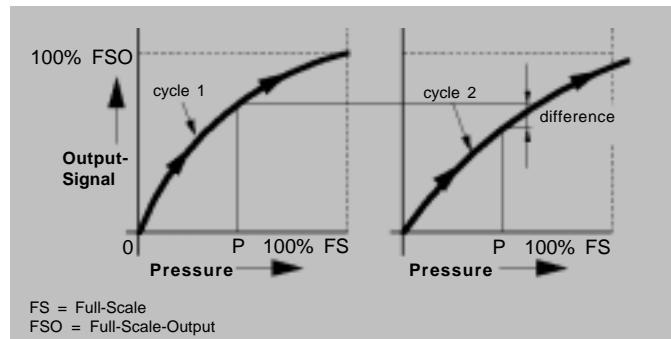

Fig. 4: Typical accuracy

### Repeat Accuracy (Reproducibility)

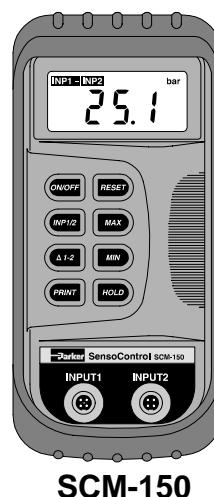

Reproducibility is the measure of approximation of the output signal, if a definite pressure is applied to a sensor in subsequent pressure cycles of short duration and under the same conditions, such as temperature and direction of the increasing or decreasing pressure. The reproducibility is determined by performing two short subsequent calibration cycles. Deviations from reproducibility are indicated as a percentage of the full output signal (FSO) and represented as a  $\pm\%$  error.

# Pressure switches SCPS

## Pressure Sensor with 2 switched outputs

- Piezoresistive Sensor element
- Adjustment range from 15 to 600 bar
- 2 switching points
- Small hysteresis
- Easy set point Setting
- Status display in plug
- Waterproof Designs
- Short circuit proof
- Reverse polarity protected

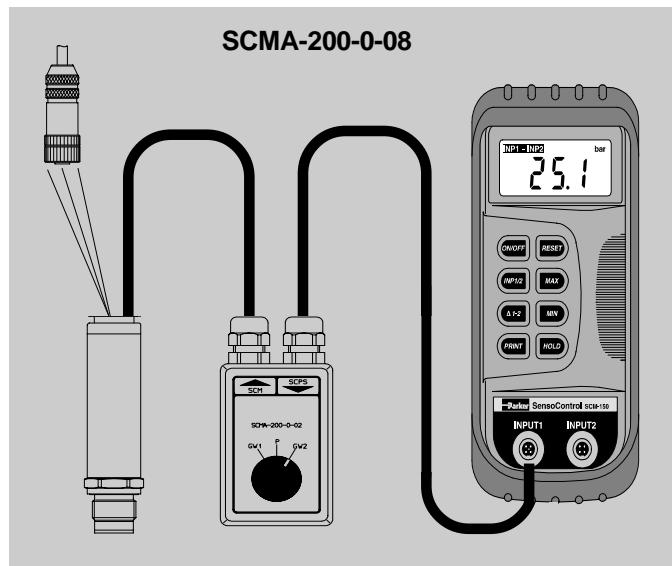

Fig. 17: Set point adjustment with SCM-150

## General description

The pressure switch SCPS is a piezoresistive sensor, with two adjustable comparators and their switching circuitry in a compact design.

High repeatability, reliability and low switching hysteresis are featured. Two separate inputs are available for separate or continuous monitoring of maximum permissible system pressures.

Both switching values are independently adjustable of each other over the full measuring range. The switching point hysteresis remains consistent.

It is also possible to adjust the switching points using the SensoControl handmeters. Both, the switching point values and the current pressure can be displayed.

The operational voltage for the pressure switch is supplied by the handmeter (see fig. 1). During installation, the pressure switch can be used as a sensor for the handmeter. To trace pressure peaks, or switching hysteresis the thermo printer can be used.

The switch output allows simple adjustment to adjust set points for normal open or normal closed operation. Currents up to 0.5A can be switched directly.

The status display at the plug connection shows the switch conditions of the respective outputs.

The pressure switch can operate equally effectively with supply voltages from 11 to 30 volts, and has over voltage as well as polarity protection. The electrical housing is filled with a semi setting gel to protect against damp penetration and vibration.

## Installation Notes

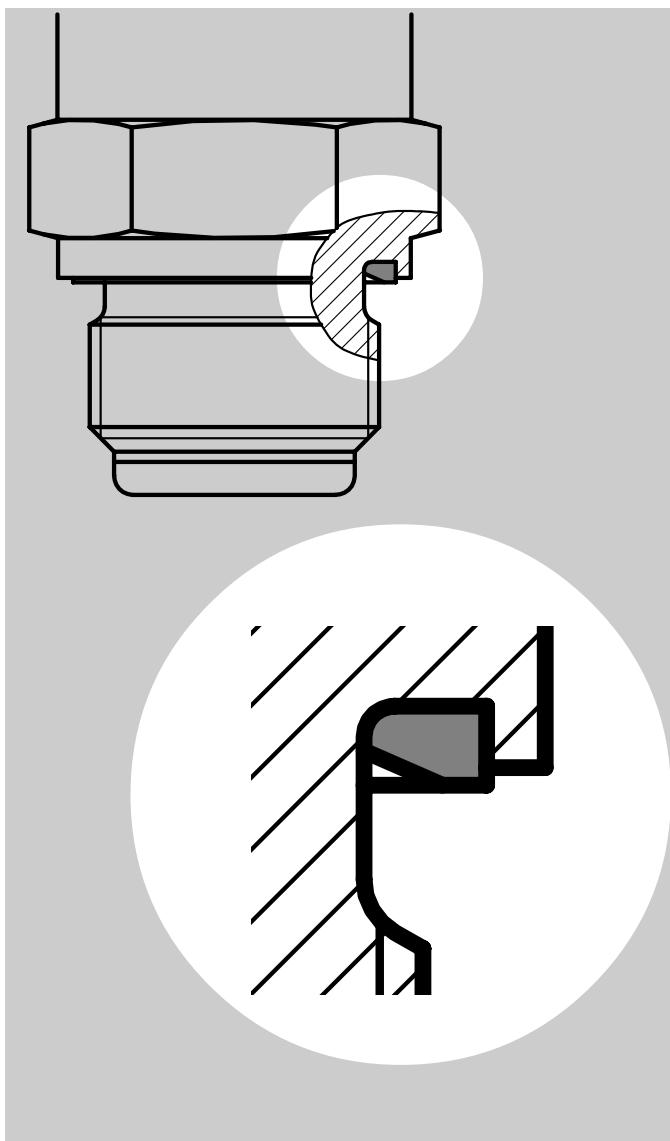

Fig. 26: Mounting position of the ED seal

To ensure proper earthing always connect metal casings with the ground reference. The PE terminal must be low-resistance grounding. The protective earth resistance must be measured according to VDE 0701.

### Supply Voltage:

The recommended supply voltage at which each standard sensor is to be operated, is indicated for the respective sensor series. We recommend using a low-noise, constant voltage source of high quality. Some specifications, such as sensitivity and thermal sensitivity shift, will change if a supply voltage other than the recommended supply voltage is used. Each sensor is designed for top performance. If the sensor is used with a supply voltage other than the one indicated, this will lead to a change in performance of the sensor. All polarity and earthing regulations should therefore be adhered to.

### Inappropriate connection of the lead wires may damage the sensor or the amplifier!

If one pole of the sensor supply voltage is automatically grounded by a signal processing system, simultaneous grounding of one of the sensor signal wires should be avoided as this may lead to a short circuit of the sensor and consequently damage it.

**Do not apply any supply voltage to the output wires as this will lead to permanent damage of the sensor!  
Exceeding the maximum supply voltage stated in the data sheet will also damage the sensor!**

### SensoControl-Sensors and EU-Conformity

As Parker feels responsible for the safety of their customers, and in accordance with the EU conformity concept, all our products bear the CE sign.

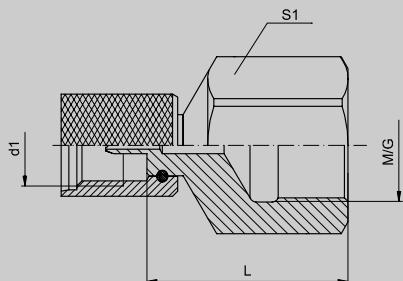

#### EMC

- Electromagnetic emitted interference: EN 50081-1
- Electromagnetic noise immunity: EN 50082-2

#### Important!

- Electromagnetic interference may affect the signal.
- Always apply standard EMC concepts machinery and equipment.
- Always use shielded connecting cables.
- Always lay analog or data lines, to protect in a safe distance from power cables.
- A good earthing avoids measuring errors.
